EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Bret Field, Reg. No. 37,620, on 28 September 2005.

The application has been amended as follows:

13. (Amended) A method of detecting the presence of an analyte nucleic acid in a sample, said method comprising:

(a) providing a nucleic acid array comprising:

(i) at least one hybridization feature to which said analyte nucleic acid specifically binds under stringent hybridization conditions; and

(ii) at least one background feature, wherein said background feature is a polymeric composition that comprises background probes that do not hybridize [specifically bind under stringent hybridization conditions] to complementary nucleic acids in said sample; (b) contacting said nucleic acid array with said sample under stringent hybridization conditions;

(c) washing said nucleic acid array;

(d) detecting a hybridization signal from said hybridization feature and background signal from said background feature;

(e) subtracting said background signal from said hybridization signal to obtain a background corrected hybridization signal; and

(f) relating said background corrected hybridization signal to the presence of said analyte target nucleic acid in said sample to detect the presence of said analyte target nucleic acid in said sample;

wherein said method is further characterized by including a target nucleic acid labeling step prior to said detecting step (d).

28. (Amended) A method of detecting the presence of an analyte nucleic acid in a sample, said method comprising:

(a) providing a nucleic acid array comprising;

(i) at least one hybridization feature to which said analyte nucleic acid specifically binds under stringent hybridization conditions; and

(ii) at least one background feature, wherein said background feature is a polymeric composition that comprises background probes that do not hybridize [specifically bind under stringent hybridization conditions] to complementary nucleic acids in said sample; (b) contacting said nucleic acid array with said sample under stringent hybridization conditions;

(c) washing said nucleic acid array;

(d) detecting a hybridization signal from said hybridization feature and background signal from said background feature;

Art Unit: 1634

(e) subtracting said background signal from said hybridization signal to obtain a background corrected hybridization signal; and

(f) relating said background corrected hybridization signal to the presence of said analyte target nucleic acid in said sample to detect the presence of said analyte target nucleic acid in said sample;

wherein said method is further characterized by including a target nucleic acid labeling step prior to said detecting step (d); and

further wherein said background feature provides a background signal following said contacting step that comprises: (i) a feature substrate background component; (ii) a probe background component; and (iii) a non-specific binding background component and tests positive in a two-color self-self array hybridization assay.
